

# Lightbox Profile Klick - Operation instructions

## Closing a box by placing the cover:

For closing the lightbox the cover is placed only loosely from the front and positioned so that the corner of the cover is precisely aligned with the corner of the frame profile. When this is done, the cover is pressed - near a corner of the box - frontal into the frame profile with a slight blow of the flat hand.

If the cover has snapped in one corner it is subsequently pressed into the frame profile over the entire length by means of short strokes.

In order to achieve an exact fitting of the covers in the case of larger boxes, it is advisable to align the covers, which touch each other in a corner, before fixing the second one.

## Opening of a Lightbox:

With the help of the suitable tool or a wide and flat screwdriver, the clipped-on cover of the Klick profiles can be easily opened. The proper tool should ideally be 2 - 3 cm wide and not more than 1 mm thick.

The tool or the screwdriver is pressed near a corner of the lightbox into the groove between the frame profile and the cover and is turned sideways. This opens the cover at this spot and can now be pulled forward in full length.
